We will make use power.anova.test in R to do the power analysis. This function needs the following information in order to do the power analysis: 1) the number of groups, 2) the between group variance 3) the within group variance, 4) the alpha level and 5) the sample size or power. As stated above, there are four groups, a=4. We will set alpha ...

Aerospace Fuel Systems Aerospace fuel systems are crucial for the efficient and safe operation of aircraft, encompassing a complex network of components designed to store, manage, and deliver fuel under varying conditions. These systems ensure optimal performance from takeoff to landing, playing a pivotal role in the aircraft's functionality. A key element of these systems

Now, if we want to see how sample size affects power, we can click "X-Y plot for a range of values", provide a range of sample sizes, and follow a graph with power as the dependent variable. Simply set power as a function of sample size with an appropriate set of sizes, here 40 students through 200 in steps of 10.

Statistical Power Analysis for One-way ANOVA Description. One-way analysis of variance (one-way ANOVA) is a technique used to compare means of two or more groups (e.g., Maxwell & Delaney, 2003). The ANOVA tests the null hypothesis that samples in two or more groups are drawn from populations with the same mean values.

The Analysis of Variance (ANOVA) is a powerful statistical technique that is used widely across various fields and industries. Here are some of its key applications: Agriculture. ANOVA is commonly used in agricultural research to compare the effectiveness of different types of fertilizers, crop varieties, or farming methods.

This Shiny app is for performing Monte Carlo simulations of factorial experimental designs in order to estimate power for an ANOVA and follow-up pairwise comparisons. This app allows you to violate the assumptions of homoscedascity and sphecicity (for repeated measures). Also, the simulations take a considerable amount of time to run.
