While natural sunlight provides vitamin D, which plays a role in immune function and bone health, it's not a primary cancer treatment. Some studies suggest a potential link between vitamin D and reduced cancer risk, but this isn't a substitute for established cancer treatments. Excessive sun exposure can increase skin cancer risk. Cancer treatment requires evidence-based medical approaches. Consult oncologists for comprehensive and safe cancer management, and discuss vitamin D levels for overall health.

Why do people use solar energy?

People have used the sun's rays (solar radiation) for thousands of years for warmth and to dry meat, fruit, and grains. Over time, people developed technologies to collect solar energy for heat and to convert it into electricity. Radiant energy from the sun has powered life on earth for many millions of years.
