where  $C$  is a positive proportionality constant called capacitance. Physically, capacitance is a measure of the capacity of storing electric charge for a given potential difference  $\Delta V$ . The SI unit of capacitance is the farad (F):  $1 \text{ F} = 1 \text{ farad} = 1 \text{ coulomb volt}^{-1} = 1 \text{ C V}^{-1}$ . A typical capacitance is in the picofarad (pF) to millifarad range, (nF).  $1 \text{ pF} = 10^{-12} \text{ F}$  ...

The power-energy performance of different energy storage devices is usually visualized by the Ragone plot of (gravimetric or volumetric) power density versus energy density [12], [13]. Typical energy storage devices are represented by the Ragone plot in Fig. 1 a, which is widely used for benchmarking and comparison of their energy storage capability.

It follows from the previous paragraph that the energy stored in the electric field depends on the geometry of the charge distribution and the permittivity of the intervening media. This relationship is what we mean by capacitance. We summarize as follows: Capacitance is the ability of a structure to store energy in an electric field. and

**DEFINITION: EQUIVALENT CAPACITANCE** oCapacitors can be connected in series, parallel, or more complex combinations oThe "equivalent capacitance" is the capacitance of a SINGLE capacitor that would have the same capacitance as the combination. oThe equivalent capacitance can replace the original combination in analysis.

Capacitance is defined as being that a capacitor has the capacitance of One Farad when a charge of One Coulomb is stored on the plates by a voltage of One volt. Note that capacitance,  $C$  is always positive in value and has no negative units. However, the Farad is a very large unit of measurement to use on its own so sub-multiples of the Farad ...

The capacitance of a capacitor is a parameter that tells us how much charge can be stored in the capacitor per unit potential difference between its plates. Capacitance of a system of conductors depends only on the geometry of their arrangement and physical properties of the insulating material that fills the space between the conductors.
