Electric vehicles (EV) are vehicles that use electric motors as a source of propulsion. EVs utilize an onboard electricity storage system as a source of energy and have zero tailpipe emissions. Modern EVs have an efficiency of 59-62% converting electrical energy from the storage system to the wheels. EVs have a driving range of about 60-400 km before needing recharging.

Electric vehicles (EVs) of the modern era are almost on the verge of tipping scale against internal combustion engines (ICE). ICE vehicles are favorable since petrol has a much higher energy density and requires less space for storage. However, the ICE emits carbon dioxide which pollutes the environment and causes global warming. Hence, alternate engine ...

The use of EV batteries for utility-level electric energy storage is, in general, accomplished with higher round-trip efficiencies than other large-scale energy storage methods - e.g. pumped hydroelectric systems (PHS) and advanced compressed-air systems (CAES) [20]. The process is often referred to as V2G (vehicles to grid) process, and the ...

Sorgato invented a compressed air driven the car in Italy that used 9 air bottles with the pressure of 2840 psi in 1975. In 1976, Ray Starbard invented a compressed air truck in Vacaville, California [9]. In 1979, Terry Miller designed a spring-powered car and demonstrated that compressed air was the ideal energy storage medium.
