Compressed air energy storage is a large-scale energy storage technology that will assist in the implementation of renewable energy in future electrical networks, with excellent storage duration, capacity and power. The reliance of CAES on underground formations for storage is a major limitation to the rate of adoption of the technology.

The global transition to renewable energy sources such as wind and solar has created a critical need for effective energy storage solutions to manage their intermittency. This review focuses on compressed air energy storage (CAES) in porous media, particularly aquifers, evaluating its benefits, challenges, and

technological advancements. Porous media-based ...

Compressed air energy storage systems may be efficient in storing unused energy, but large-scale applications have greater heat losses because the compression of air creates heat, meaning expansion is used to ensure the heat is removed [[46], [47]]. Expansion entails a change in the shape of the material due to a change in temperature.

Le « CAES », (de l'anglais Compressed Air Energy Storage) est un mode de stockage d'énergie par air comprimé, c'est-à-dire d'énergie mécanique potentielle, qui se greffe sur des turbines à gaz.. Comment ça marche ? Dans une turbine à gaz classique, de l'air ambiant est capté et comprimé dans un compresseur à très haute pression (100 à 300 bar).

Compressed air energy storage (CAES) uses excess electricity, particularly from wind farms, to compress air. Re-expansion of the air then drives machinery to recoup the electric power. Prototypes have capacities of several hundred MW. Challenges lie in conserving the thermal energy associated with compressing air and leakage of that heat ...

What is Compressed Air Energy Storage (CAES)? Compressed Air Energy Storage is a technology that stores energy by using electricity to compress air and store it in large underground caverns or tanks. When energy is needed, the compressed air is released, expanded, and heated to drive a turbine, which generates electricity.

Compressed Air Energy Storage (CAES) technology offers a viable solution to the energy storage problem. It has a high storage capacity, is a clean technology, and has a long life cycle. Additionally, it can utilize existing natural gas infrastructure, reducing initial investment costs.

Development of second generation CAES like hybrid, adiabatic or isothermal CAES (I-CAES, compare Sections 4 Diabatic compressed air energy storage, 5 Adiabatic compressed air energy storage, 6 Isothermal compressed air energy storage) was postponed and linked to a successful implementation of D-CAES in the USA.

The heat from solar energy can be stored by sensible energy storage materials (i.e., thermal oil) [87] and thermochemical energy storage materials (i.e., $\text{CO}_3\text{O}_4/\text{CoO}$) [88] for heating the inlet air of turbines during the discharging cycle of LAES, while the heat from solar energy was directly utilized for heating air in the work of [89].
