What is the equation for energy stored in a capacitor?

The equation for energy stored in a capacitor can be derived from the definition of capacitance and the work done to charge the capacitor. Capacitance is defined as: $C = Q/V$ Where Q is the charge stored on the capacitor's plates and V is the voltage across the capacitor.

How do you calculate potential energy in a capacitor?

Energy stored in a capacitor is electrical potential energy, and it is thus related to the charge Q and voltage V on the capacitor. We must be careful when applying the equation for electrical potential energy $DPE = qDV$ to a capacitor. Remember that DPE is the potential energy of a charge q going through a voltage DV .

How do you calculate the energy needed to charge a capacitor?

The total work W needed to charge a capacitor is the electrical potential energy U_C stored in it, or $U_C = W$. When the charge is expressed in coulombs, potential is expressed in volts, and the capacitance is expressed in farads, this relation gives the energy in joules.

The expression in Equation 8.4.2 for the energy stored in a parallel-plate capacitor is generally valid for all types of capacitors. To see this, consider any uncharged capacitor (not necessarily a parallel-plate type). At some instant, we connect it across a battery, giving it a potential difference $V = q/C$ between its plates.
