

The electrified railway system is widely distributed and consumes a lot of energy. As of the end of 2020, the operating mileage of electrified railways across the country has exceeded 100,000 km, high-speed railway has reached 36,000 km [1]. With the rapid development of electrified railways, while making it easier for people to travel, energy demand is also ...

Renewable energy utilization for electric power generation has attracted global interest in recent times [1], [2], [3]. However, due to the intermittent nature of most mature renewable energy sources such as wind and solar, energy storage has become an important component of any sustainable and reliable renewable energy deployment.

In DC microgrids, a large-capacity hybrid energy storage system (HESS) is introduced to eliminate variable

fluctuations of distributed source powers and load powers. Aiming at improving disturbance immunity and decreasing adjustment time, this paper proposes active disturbance rejection control (ADRC) combined with improved MPC for $n + 1$ parallel ...

Abstract: The study introduces a bidirectional dc-dc converter with current- and voltage-fed (VF) ports that features soft switching in both buck and boost operating modes. The converter can be used for integration of low-voltage DC sources, such as batteries into a dc bus of considerably higher voltage or a dc link of a grid side inverter.

The deployment of energy storage systems relies directly on bidirectional DC-DC converters (BDC) for connection to the DC bus of the power system [8, 9]. The functions of BDCs in energy storage systems typically include managing power flow, converting voltage levels, and ensuring the health of the energy storage device by controlling charging ...

Fig. 1 demonstrates the topology of grid-connected DFIG with DC-side energy storage batteries. The stator of the DFIG is directly linked to the grid, while the rotor is directly connected to the grid via a back-to-back converter. The back-to-back converter is composed of the rotor side converter (RSC), grid side converter (GSC), and their bridged DC capacitor.

The integration of the energy storage system into a grid-side converter requires the use of a bi-directional DC-DC converter with a battery controller for the energy storage system in the middle and the dynamic regulation of active and reactive power by taking the limiting value of the power reference value P_{ref} , when it exceeds the ...

capacitance increases. Consequently, the ripple current that flows through the energy storage capacitor will increase, so that capacitor loss will increase to the pole and then gradually decrease [4]. It is noticeable that the DC-side energy storage capacitance will have a certain impact on the whole circuit, so we need to focus on the DC-side ...

storage systems are identical as other forms of energy storage methods, as mentioned earlier. A typical thermal energy storage system consists of three sequential processes: charging, storing, and discharging periods.

The use of distributed energy resources (DERs), interfaces with different frequency networks, battery energy storage systems (BESS), DC loads, vehicle-to-grid (V2G), grid-to-vehicle (G2V), regulating voltages and do not experience losses (proximity and skin effects) have further strengthened the importance of DC networks (Parhizi et al., 2015 ...

In this paper, the working principle of three level bidirectional DC-DC converter was introduced. The relationship between output voltage and input voltage was deduced. From this, the relationship between inductance current and duty cycle was received. Then, the influence of switching states on the inductance current in supercapacitor energy storage system was ...

A DC voltage is a voltage that produces, or would produce, DC current, and an AC voltage produces or would produce AC current--and this introduces another terminology problem. "DC" and "AC" are sometimes attached to the word "current," even though these phrases mean "direct-current current" and "alternating-current current."
