How to compensate a power system network?

There are various methods established for compensation of the power system network. According to the type of connection of compensation devices with the power system network, the compensation techniques are classified into two types; In series compensation, the FACTS devices are connected in series with the power system network.

What is a series compensation device?

In series compensation, the FACTS devices are connected in series with the power system network. This device can be a variable impedance like a capacitor or an inductor. Generally, the capacitor is connected in series with the transmission line. It is mostly used to improve the power transfer capability of EHV/UHV transmission lines.

What is compensation in power system?

Introduction to Compensation in Power System - For reduction of cost and improved reliability, most of the world's electric power systems continue to be interconnected. Interconnections take advantage of diversity of loads, availability of sources and fuel price for supplying power to loads at minimum cost and pollution with a required reliability.

Load Compensation in Power System: Load compensation is the management of reactive power to improve power quality i.e. V profile and pf. Here the reactive power flow is controlled by installing shunt compensating devices (capacitors/reactors) at the load end bringing about proper balance between generated and consumed reactive power.

The connection of compensating capacitors on the primary and secondary sides is used to classify different types of compensation topologies for WPT system (Barman et al., 2015; Houran et al., 2018; Moore et al., 2019). The goal of this review paper is to study the various types of compensation topologies and, as a result, to select the most ...

Line Compensation in Power System: Line Compensation - Ideal voltage profile for a transmission line is flat, which can only be achieved by loading the line with its surge impedance loading while this may not be achievable, the characteristics of the line can be modified by line compensators so that.
