

A large number of battery pack returns from electric vehicles (EV) is expected for the next years, which requires economically efficient disassembly capacities. This cannot be met through purely manual processing and, therefore, needs to be automated. The variance of different battery pack designs in terms of (non-) solvable fitting technology and superstructures ...

In the context of current societal challenges, such as climate neutrality, industry digitization, and circular economy, this paper addresses the importance of improving recycling practices for electric vehicle (EV) battery packs, with a specific focus on lithium-ion batteries (LIBs). To achieve this, the paper conducts a systematic review (using Google Scholar, ...

A data storage product may be composed of integrated storage controllers, data storage devices, embedded network elements, software, and other devices. 3.1.4 data storage device [b-EU 2019/424]: Device providing non-volatile data storage, with the exception of aggregating storage elements such as subsystems of redundant arrays of independent

Wearable energy storage devices are desirable to boost the rapid development of flexible and stretchable electronics. Two-dimensional (2D) materials, e.g., graphene, transition metal dichalcogenides and oxides, and MXenes, have attracted intensive attention for flexible energy storage applications because of their ultrathin 2D structures, high surface-to-volume ...

The rapidly increasing adoption of electric vehicles (EVs) globally underscores the urgent need for effective management strategies for end-of-life (EOL) EV batteries. Efficient EOL management is crucial in reducing the ecological footprint of EVs and promoting a circular economy where battery materials are sustainably reused, thereby extending the life cycle of ...

This mechanism may be implemented due to a special material geometry, namely, a distribution of two different dielectrics in a spatiotemporal checkerboard. We concentrate on practically reasonable means to bring this mechanism into action in a device that may work both as energy generator and energy storage.

AD is based on the concept of shape memory alloy (SMA) or shape memory polymer (SMP) that can spontaneously reverse back to their initial shape upon exposure to a specific circumstance using active disassembling devices. Active disassembly device is implemented in the products during their design and assembly stages.

Reuse, also known as repurposing or echelon reuse, is to apply those retired EV-LIBs with considerable remaining capacity into other systems such as energy storage systems (Martinez-Laserna et al., 2018; Hua et al., 2020; Reinhardt et al., 2019). Remanufacturing is to replace all the defective modules and/or cells to restore the EV-LIBs as good ...
