What is a load disconnecting system?

Disconnection means is an important consideration with these systems. This information is found at 706.8 (A). It is crucial that the load disconnecting means serving multiple sources of power disconnects all energy sources when in the off position. This helps to ensure worker safety, as well as the safety of the equipment and the structure.

Non-load break-bolted or plug-in disconnects are permitted. Another aspect to an ESS is the storage system maintenance disconnecting means.

Do I need a source and equipment disconnect?

Depending on the ESS design and components, a combination of source and equipment disconnects might be needed to isolate the ESS from other systems, the premise wiring, and the utility grid. Disconnect devices may satisfy source and equipment requirements within a single enclosure or switch.

How do I plan a new energy storage system?

It is important to plan and discuss the location of an energy storage system with the electrical inspection authorities before installation of this equipment. In many cases, this will include the building inspector and the fire marshal.

Are energy storage systems connected to other energy sources?

Energy storage systems can be (and typically are) connected to other energy sources, such as the local utility distribution system. There may be one or more sources connected to an ESS. The connection to other energy sources is required to comply with the requirements of 705.12.

Why is overcurrent protection important for energy storage systems?

As with other aspects of an electrical system, proper overcurrent protection for energy storage system circuits and equipment is an important aspect of a safe and properly functioning ESS. Circuit conductors need to be protected in accordance with the requirements of Article 240.
