

Earth solar system size comparison

How big is Earth compared to the Sun?

In a planet size comparison, Earth's equatorial circumference is 24,901 miles (40,075 kilometers), and its diameter is 7,926 miles (12,756 kilometers). Read also: How Many Earths Can Fit in the Sun? In a planet size comparison, Mars is the fourth planet in the solar system regarding distance from the Sun and ranks seventh in size and mass.

How big is the Solar System?

The solar system is really mostly empty space. The Sun is much much bigger than all the planets, in fact, you could fit over a million Earths inside the Sun! The next biggest object in the Solar System is Jupiter, a gas giant planet. Its mass is about 318 times that of the Earth.

How wide is a planet compared to the Earth's equatorial diameter?

Each planet's width is compared to Earth's equatorial diameter, which is about 7,926 miles (12,756 kilometers). At the bottom of the page, there is a handy list of the order of the planets moving away from our Sun. Jupiter is the largest planet in the solar system.

What are the sizes of planets based on the equatorial diameter?

This is a simple guide to the sizes of planets based on the equatorial diameter - or width - at the equator of each planet. Each planet's width is compared to Earth's equatorial diameter, which is about 7,926 miles (12,756 kilometers). At the bottom of the page, there is a handy list of the order of the planets moving away from our Sun.

How many planets are in our Solar System?

According to NASA, this is the estimated radii of the eight planets in our solar system, in order of size. We also have included the radii sizes relative to Earth to help you picture them better. Eight planets and a dwarf planet in our Solar System, approximately to scale. Pluto is a dwarf planet at far right. At far left is the Sun.

What are the approximate sizes of the planets relative to each other?

This illustration shows the approximate sizes of the planets relative to each other. Outward from the Sun, the planets are Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune, followed by the dwarf planet Pluto. Jupiter's diameter is about 11 times that of the Earth's and the Sun's diameter is about 10 times Jupiter's.

The size of Earth compared to other planets and stars (and the Universe) - star size comparison. Some objects mentioned in the video: Ganymede (Jupiter III) is the largest moon of Jupiter and in the Solar System, and the only moon known to have a magnetic field also probably has an internal ocean that may contain more water than all of Earth's oceans combined.

The size of planets in our solar system varies dramatically. Let's explore the sizes of the planets, including

Earth solar system size comparison

their radius and diameter in both kilometers and miles, and their relative sizes compared to Earth. ... This table compares the radius, diameter, and relative size of each planet compared to Earth. Planet Radius (km/mi) Diameter (km ...

Jupiter is the largest planet in our solar system - here's how tiny North America looks compared to it. Image credits: John Brady/Astronomy Central When we say Jupiter is big, we mean it's huge. Here are some numbers to help you understand just how big it is: Earth's radius is 6371.0 km (3958.8 mi) while Jupiter's radius is 69,911 km (43,441 mi).

The planets in our solar system are each very unique for various reasons. When it comes to their measurable sizes in diameter, the planets vary greatly. ... Another size comparison puts Earth at 3.67 times the diameter of the Moon. 6. Earth's "twin planet" Venus is only slightly smaller than Earth with a diameter of 12,104 km.

To fully understand the scale of our sun, let's compare its size to each planet of our solar system. Mercury: The Sun is 277 times larger than Mercury. 21 million Mercury-sized planets could fit inside the Sun. Venus: The Sun is 115 times larger than Venus. 1.5 million Venus-sized planets could fit inside the Sun.; Earth: The Sun is 109 times larger than Earth.

Parts-per-million chart of the relative mass distribution of the Solar System, each cubelet denoting 2 × 10²⁴ kg. This article includes a list of the most massive known objects of the Solar System and partial lists of smaller objects by observed mean radius. These lists can be sorted according to an object's radius and mass and, for the most massive objects, volume, density, and surface ...

Our solar system is huge. There is a lot of empty space out there between the planets. Voyager 1, the most distant human-made object, has been in space for more than 40 years and it still has not escaped the influence of our Sun. As of Feb. 1, 2020, Voyager 1 is about 13.8 billion miles (22.2 billion kilometers) from the Sun -- nearly four times the average ...

The Solar System to Scale in which every pixel on the screen represents 1,000 kilometers. Scroll down. The Sun (Yellow Dwarf Star) ... Diameter: 12 pixels Distance: pixels. Earth (Terrestrial Planet) Diameter: 12 pixels Distance: pixels. Mars (Terrestrial Planet) Diameter: 6 pixels Distance: pixels. Jupiter (Gas Giant) Diameter: 139 pixels ...

Compare the Planets. Our Solar System has eight planets. Four of these are Giants: Jupiter, Saturn, Neptune, Uranus. Did you know if you try to stand on Jupiter you would sink right through as it is made out of gas? Did you know Saturn is 95 times more massive than Earth? Compare Planets, Moons and other objects side-by-side in this 3D live ...

Earth vs Mars Earth vs Mars size comparison. A common misconception is that Mars is big, when in fact, it is the second smallest planet in the Solar system. If you compare its diameter with Earth's, Mars is almost half the size of our planet. When you compare both planets by volume, it turns out you could fit 6.5 Mars-sized

Earth solar system size comparison

planets on Earth.

In a planet size comparison, Earth is the third planet closest to the Sun and the fifth biggest in our solar system. In a planet size comparison, Earth's equatorial circumference is 24,901 miles (40,075 kilometers), and its diameter is 7,926 miles (12,756 kilometers).

Earth is a big place. If you could drive around the entire planet, it would take more than sixteen days of non-stop driving at highway speeds. But, compared to some of the planets in our solar system, it's pretty small. We often see planets displayed as similar in size, like this, ...

Between small planets in the solar system and the biggest stars, the size difference is enormous, for example, the diameter of the star Betelgeuse is 141,863 times larger than the diameter of the Earth. ... Image: Size of the Earth compared to the size of a white dwarf (left). White dwarfs are stars off residues.

In a planet size comparison, Earth is the third planet closest to the Sun and the fifth biggest in our solar system. In a planet size comparison, Earth's equatorial circumference is 24,901 miles (40,075 kilometers), and its diameter ...

The Moon's diameter is 3,474 km / 2,158 mi, and it is the biggest Moon in the Solar System relative to the size of its planet. When it comes to other satellites, the Moon is the fifth largest satellite in the Solar System. So let's take a look at the top 10 biggest moons in the Solar System. Top 10 Biggest Moons in the Solar System

Earth, for comparison, has a radius of only 2.439 km / 1.516 mi, and a diameter of just 12.742 km / 7.917 mi. All the planets in our Solar System combined account for just 0.2% of the Sun's mass. Earth, for example, is 330.000 times less massive than the ...

The next biggest object in the Solar System is Jupiter, a gas giant planet. Its mass is about 318 times that of the Earth. A solar eruption captured by SOHO (Solar and Heliospheric Observatory). The Earth is shown here for size comparison. Image credit: SOHO (ESA & NASA) Distances. There are four rocky planets and four giant planets in our ...

This unit provides an easy way to quickly compare planets' distances from the Sun. It takes about eight minutes for light from the Sun to reach our planet. Orbit and Rotation. ... When the solar system settled into its current layout about 4.5 billion years ago, Earth formed when gravity pulled swirling gas and dust in to become the third ...

(4.5 billion kilometers). Compare this to the farthest distance you can walk in one full day (70 miles) or that the International Space Station travels in 24 hours (400,000 miles). The best way to appreciate the size of our solar system is by creating a scaled model of it that shows how far from the sun the eight planets are located ...

Earth solar system size comparison

The size of the sun compared to earth. The Earth could fit inside the Sun 12,000 times; If the Sun were a front door, the Earth would be the size of a nickel; The size of the sun compared to the combination of all of the solar system's planets. The Sun makes up 99.8% of the mass in ...
