

Electrochemistry supports both options: in supercapacitors (SCs) of the electrochemical double layer type (see Chap. 7), mode 1 is operating; in a secondary battery or redox flow battery (see Chap. 21), mode 2 most systems for electrochemical energy storage (EES), the device (a battery, a supercapacitor) for both conversion processes is the same.

A flow battery contains two substances that undergo electrochemical reactions in which electrons are transferred from one to the other. When the battery is being charged, the transfer of electrons forces the two substances into a state that's "less energetically favorable" as it stores extra energy.
