Multiple catalysts have exhibited high activity on improving the hydrogen storage performance of magnesium hydride. Herein, TiFe as a superior catalyst was successfully prepared, and then doped into MgH<sub>2</sub> via ball milling to improve the de/rehydrogenation properties of MgH<sub>2</sub> at low temperatures. Compared with as-prepared MgH<sub>2</sub>, the onset desorption ...

The ball used for ball milling was 2-kg steel balls (3 mm) with a ball-to-material ratio of 20:1. The ball-milling speed was set to 1100/1200 rpm (alternating between 1100 and 1200 rpm for 1 min). High-energy ball milling was performed under the protective atmosphere of argon gas for 6 h to prevent oxidation or decomposition of the hydrogen ...

The disassembled batteries were taken and placed over the conductive carbon tape. To determine the content of Li ions in the  $\text{Cr}_2\text{S}_3$  phase after high-energy ball milling, the  $\text{Cr}_2\text{S}_3$  and LPSC powders with weight ratio of 1:1 was first obtained by high-energy ball milling for 60 min. The mixture was then put into deionized water and vacuum ...

Ball milling is a commonly used mechanical method for the preparation of metal hydrides, which can improve the hydrogen storage properties of magnesium alloys by reducing the particle size and increasing the surface area, thus facilitating hydrogen absorption and desorption [9].The development of magnesium alloys through ball milling has the potential to ...
