Energy storage is an issue at the heart of the transition towards a sustainable and decarbonised economy. One of the many challenges faced by renewable energy production (i.e., wind, solar, tidal) is how to ensure that the electricity produced from these intermittent sources is available to be used when needed - as is currently the case with energy produced ...

Energy storage can be used to lower peak consumption (the highest amount of power a customer draws from the grid), thus reducing the amount customers pay for demand charges. Our model calculates that in North America, the break-even point for most customers paying a demand charge is about \$9 per kilowatt. Based on our prior work looking at the ...
