What is a battery energy storage system?

BESS are the power plants in which batteries, individually or more often when aggregated, are used to store the electricity produced by the generating plants and make it available at times of need. The fundamental components of a Battery Energy Storage System are the blocks formed by the batteries, but other elements are also present.

Who uses battery energy storage systems?

The most natural users of Battery Energy Storage Systems are electricity companies with wind and solar power plants. In this case, the BESS are typically large: they are either built near major nodes in the transmission grid, or else they are installed directly at power generation plants.

What is a Bess energy storage system?

BESS are one of the main energy storage systems: sometimes they are also called electrochemical energy systems to distinguish them from others, such as gravitational energy systems (including pumped-storage hydroelectric power plants), mechanical energy systems (including compressed air or flywheel systems) and (Thermal Energy Storage, TES) systems

Why is energy storage important?

Energy storage is one of the most prominent elements in the ongoing energy transition. Indeed, its role is increasingly crucial in light of the large-scale deployment of intermittent and unpredictable renewable sources.

What is the future of energy storage?

Storage enables electricity systems to remain in balance despite variations in wind and solar availability, allowing for cost-effective deep decarbonization while maintaining reliability. The Future of Energy Storage report is an essential analysis of this key component in decarbonizing our energy infrastructure and combating climate change.

Can energy storage accelerate full decarbonization of the electric grid?

Energy storage has the potential to accelerate full decarbonization of the electric grid. While shorter duration storage is currently being installed to support today's level of renewable energy generation, longer duration storage technologies are needed as more renewables are deployed on the grid.
