How can advanced energy storage systems be safe?

The safe operation of advanced energy storage systems requires the coordinated efforts of all those involved in the lifecycle of a system, from equipment designers, to OEM manufacturers, to system designers, installers, operators, maintenance crews, and finally those decommissioning systems, and, first responders.

Can a large-scale solar battery energy storage system improve accident prevention and mitigation?

This work describes an improved risk assessment approach for analyzing safety designs in the battery energy storage system incorporated in large-scale solar to improve accident prevention and mitigation, via incorporating probabilistic event tree and systems theoretic analysis. The causal factors and mitigation measures are presented.

Are grid-scale battery energy storage systems safe?

Despite widely known hazards and safety design of grid-scale battery energy storage systems, there is a lack of established risk management schemes and models as compared to the chemical, aviation, nuclear and the petroleum industry.

How should energy storage systems be designed?

Designing resilient systems: although it is impossible to design for any scenario, energy storage systems should be designed to withstand common and uncommon environmental hazards in the areas they will be deployed.

How do you ensure energy storage safety?

Ultimately, energy storage safety is ensured through engineering quality and application of safety practices to the entire energy storage system. Design and planning to prevent emergencies, and to improve any necessary response, is crucial.

What are the NFPA guidelines for energy storage systems?

The guidelines provided in NFPA 855 (Standard for the Installation of Energy Storage Systems) and Chapter 1207 (Electrical Energy Storage Systems) of the International Fire Code are the first steps. Thermal Runaway Prevention and mitigation measures should be directed at thermal runaway, which is by far the most severe BESS failure mode.

1 ¶ As the world accelerates its transition to a renewable and low-carbon future, hydrogen, along with its derivatives, is emerging as a critical component for decarbonizing hard-to-abate sectors and possibly contributing to decarbonized energy security through seasonal energy storage in the long term. Battery energy storage systems (BESS) have been in the news after being affected by a series of high-profile fires. For instance, there were 23 BESS fires in South Korea between 2017 and 2019, resulting in losses valued at \$32 million - with the resulting investigation attributing the main causes to system design, faulty installations and inadequate maintenance. <sup>1</sup>

In utility risk management, a wide array of operational, financial, market, regulatory, and compliance issues can potentially disrupt energy production and distribution. To ensure operational stability, utilities must establish procedures that quickly and accurately identify, assess, and help mitigate issues that could arise due to these risks.

The compliance risk management process is a structured approach to identifying, assessing, managing, and monitoring the risks of non-compliance with applicable laws and regulations. It typically involves: **Risk Identification:** Determining what compliance risks exist;

Furthermore, as outlined in the US Department of Energy's 2019 "Energy Storage Technology and Cost Characterization Report", lithium-ion batteries emerge as the optimal choice for a 4-hour energy storage system when evaluating cost, performance, calendar and cycle life, and technology maturity. <sup>2</sup> While these advantages are significant ...

most energy storage in the world joined in the effort and gave EPRI access to their energy storage sites and design data as well as safety procedures and guides. In 2020 and 2021, eight BESS installations were evaluated for fire protection and hazard mitigation using the ESIC Reference HMA. Figure 1 - EPRI energy storage safety research timeline

Preventative measures include, for example, compliance risk management, guidelines and procedures, and comprehensive training and advising of employees. Communication channels such as our "Speak up" reporting system and ombudsperson as well as fair internal investigations are indispensable to recognizing and resolving matters of misconduct.
