

Thermal Energy Storage and Buffer Tanks for Cooling. Thermal energy storage (TES) is a method used to manage peaks in district heating and cooling systems. It involves storing hot or cold water in insulated tanks to be used when demand increases, reducing the need to start additional production units and minimizing environmental impact and costs .

Currently most thermal energy storage systems use a sensible heat process, though significant research and development activity is being put into latent heat and thermo-chemical heat storage, which could result in greater future usage. Mechanical Energy Storage. Mechanical energy storage systems use kinetic or gravitational forces to store energy.
