Storage should be co-optimized with clean generation, transmission systems, and strategies to reward consumers for making their electricity use more flexible.

Can battery energy storage power us to net zero?

Battery energy storage can power us to Net Zero. Here's how | World Economic Forum The use of battery energy storage in power systems is increasing. But while approximately 192GW of solar and 75GW of wind were installed globally in 2022, only 16GW/35GWh (gigawatt hours) of new storage systems were deployed.

Why is energy storage important in a decarbonized energy system?

In deeply decarbonized energy systems utilizing high penetrations of variable renewable energy (VRE), energy storage is needed to keep the lights on and the electricity flowing when the sun isn't shining and the wind isn't blowing -- when generation from these VRE resources is low or demand is high.

Why do we need a co-optimized energy storage system?

The need to co-optimize storage with other elements of the electricity system, coupled with uncertain climate change impacts on demand and supply, necessitate advances in analytical tools to reliably and efficiently plan, operate, and regulate power systems of the future.

Should energy storage systems be mainstreamed in the developing world?
