

Thermal energy is usually collected by a parabolic trough, transferred to thermal storage by a heat transfer fluid, and then transferred to a steam generator by storage media. For active thermal energy storage in a direct system, the heat transfer fluid collects the solar heat and also serves as storage medium.

Thermal energy storage (TES) systems can store heat or cold to be used later, at different temperature, place, or power. The main use of TES is to overcome the mismatch between energy generation and energy use (Mehling and Cabeza, 2008, Dincer and Rosen, 2002, Cabeza, 2012, Alva et al., 2018).The mismatch can be in time, temperature, power, or ...
