What is an Industrial Chiller? An industrial chiller is a powerful cooling device designed to remove heat from various industrial equipment and processes. It operates by pulling heat away from machinery and processing it through a refrigeration cycle involving chilled water or air circulation.

This energy can be generated by chillers for cooling or by capturing waste heat from industrial processes. A crucial component in this process is the buffer tank which is a giant thermal battery. These well-insulated tanks, filled with water or a material with high thermal capacity, store the captured energy with minimal heat loss.

and/or cooling demand of many buildings is generally more efficient than a collection of diverse on-site heating and cooling systems that ramp steeply up and down to meet daily and hourly needs of individual

buildings. 7. A district energy distribution system serves as a type of energy storage, with steam, hot water, or chilled water circulating in

During the off-peak period, the glycol chiller is operational. The glycol chilling system generates low temperature glycol that circulates through the tubes of the thermal storage coils. The circulating glycol removes heat from the water in the tanks, causing the water to freeze onto the exterior surface of the thermal storage coils. Melt-Out
