Results showed that the thermal properties of the thermal energy storage core material and the pipe spacing of both embedded pipes in the ...

The traditional brick bungalow is not conducive to long-term grain storage because of its poor thermal insulation. In this paper, a new type of wall element for grain bungalows with both load-carrying and thermal insulation functions, called a "Structure-Insulation" integrated wall panel (SIW), is proposed for improving the grain storage environment. To study ...

Fire spread prevention structures are essential to improve the fire safety performance of buildings. This external insulation system efficiently promote energy saving in building; additionally, leveraging a phase change material to improve the thermal storage performance of the building can reduce energy consumption by up to 11.9 %.

A considerable number of studies have been devoted to overcoming the aforementioned bottlenecks associated with solid-liquid PCMs. On the one hand, various form-stable phase change composites (PCCs) were

In the past decade, the cost of energy storage, solar and wind energy have all dramatically decreased, making solutions that pair storage with renewable energy more competitive. In a bidding war for a project by Xcel Energy in Colorado, the median price for energy storage and wind was \$21/MWh, and it was \$36/MWh for solar and storage (versus ...

Phase change energy storage technology using PCM has shown good results in the field of energy conservation in buildings (Soares et al., 2013). The use of PCM in building envelopes (both walls and roofs) increases the heat storage capacity of the building and might improve its energy efficiency and hence reduce the electrical energy consumption for space ...

The penetration of renewable energy sources into the main electrical grid has dramatically increased in the last two decades. Fluctuations in electricity generation due to the stochastic nature of solar and wind power, together with the need for higher efficiency in the electrical system, make the use of energy storage systems increasingly necessary.

The calculated energy storage results are shown in Figure 5. It can be seen that the difference in the energy storage performance of the five groups of samples at 20 °C is small, and the effect of PI content on the energy storage performance ...

There are essentially three methods for thermal energy storage: chemical, latent, and sensible [14] emical storage, despite its potential benefits associated to high energy densities and negligible heat losses, does not yet show clear advantages for building applications due to its complexity, uncertainty, high costs, and the lack of a suitable material for chemical ...

The dielectric energy storage performance of HBPDA-BAPB manifests better temperature stability than CBDA-BAPB and HPMDA-BAPB from RT to 200 °C, mainly due to the exceptionally high and stable charge-discharge efficiency of >98.5 %. This allows HBPDA-BAPB to have a relatively low energy loss density within a wide operating temperature range.

Therefore, SME on polymer materials can directly enhance surface insulation strength, and then it also similarly enhances insulation property under harsh high-frequency electric field [57]; the improved surface insulation property further directly improves monolithic insulation strength of polymer material for doubly increasing energy storage ...

Compared with batteries and supercapacitors, dielectric capacitors have the advantages of fast charging/discharging, high power density, and long lifetime, which makes them widely used in the pulse power fields [1, 2]. Polymer films are more favourable for capacitors because of the high insulation property, good flexibility, low cost and ease of preparation on a ...
