# Energy storage inverter development plan

The main difference with energy storage inverters is that they are capable of two-way power conversion - from DC to AC, and vice versa. It's this switch between currents that enables energy storage inverters to store energy, as the name implies. In a regular PV inverter system, any excess power that you do not consume is fed back to the grid.

In general, the choice of an ESS is based on the required power capability and time horizon (discharge duration). As a result, the type of service required in terms of energy density (very short, short, medium, and long-term storage capacity) and power density (small, medium, and large-scale) determine the energy storage needs [53]. In addition ...

Although using energy storage is never 100% efficient--some energy is always lost in converting energy and retrieving it--storage allows the flexible use of energy at different times from when it was generated. So, storage can increase system efficiency and resilience, and it can improve power quality by matching supply and demand.
