Energy storage materials such as batteries, supercapacitor, solar cells, and fuel cell are heavily investigated as primary energy storage devices [3] ... The superb electrochemical performance of these materials may be attributed to the formation of conductive network within the composite. Wei and co-workers have fabricated MWCNT/S composite ...

Although the LIBSC has a high power density and energy density, different positive and negative electrode materials have different energy storage mechanism, the battery-type materials will generally cause ion transport kinetics delay, resulting in severe attenuation of energy density at high power density [83], [84], [85]. Therefore, when AC is ...

In addition, latent heat storage has the capacity to store heat of fusion nearly isothermally which corresponds to the phase transition temperature of the phase change material (PCM) [4]. Latent heat storage based on PCM can be applied in various fields, such as solar heat storage, energy-saving buildings and waste heat recycle, etc.

With the merits of inherent physicochemical properties of hollow structure, high mechanical strength, thermal stability, ultrahigh light absorption capacity, and ultrahigh thermal conductivity, carbon nanotubes (CNTs) are extensively used to enhance the thermal storage capabilities of solid-liquid phase change materials (PCMs).
