These materials show tempting chemical properties that make them appropriate materials for energy storage applications. CSMOF has a core and a shell in which the core is the inner part and the shell is the outer layer.

What materials are used for energy storage in SC?

Traditionally, Nano carbons like activated carbons, carbon nanotubes, and graphene; conducting polymers like PPy, PEDOT, and PANI; Metal oxides like MnO_2 , V_2O_5 , and Nb_2O_5 were used for energy storage in SC.

Can a 2D shell structure improve electrochemical properties?

Using a similar approach, Pang et al. synthesized a core-shell structure of $CuCo_2S_4@CoS_2$ using ZIF-67 supported by rGO/Ni foam. Since the 2D structure is the most beneficial for charge transfer, designing the shell of a core-shell structure with 2D sheets could lead to improved electrochemical characteristics.
