Optimization solutions can be divided into traditional optimization methods and new technologies. Traditional optimization methods include linear programming, mixed-integer linear programming, and quadratic programming. New technologies primarily refer to deep learning (DL), deep reinforcement learning (DRL), and blockchain technology.

the measurement directly at the IT load (e.g. servers, storage, networking, etc.). The recommendation is to measure the IT energy at the output of the PDU. At a minimum IT energy measurements should be measured at the output of the UPS. For a data center, total energy measurement should include all energy sources at the point of utility handoff.

The methods for evaluating energy efficiency are summarized in this section. Approaches for evaluating data center energy efficiency can be split into three categories: measurement-based methods, simulation-based methods, and analytical modeling-based methods [32], [33]. The measurement-based evaluation is the most accurate of the three.

A power distribution unit, also known as PDU, refers to a device fitted with multiple outputs designed to control and distribute electric power, which is normally used in the racks of networking equipment located in a data center.. A basic PDU performs the same job as a power strip, which provides multiple devices using the current of a single power source, such ...

Data related to the performance of burst containments for high-speed rotating machines, such as flywheel energy storage systems (FESS), turbines or electric motors is scarce. However, development of optimized burst containment structures requires statistically significant data, which calls out for low-cost test methods as a strategic development tool. Consequently, a low-cost ...

o When calculating PUE, IT energy consumption should, at a minimum, be measured at the output of the uninterruptible power supply (UPS). However, the industry should progressively improve measurement capabilities over time so that measurement of IT energy consumption directly at the IT load (e.g., servers, storage, network, etc.) becomes
