A CONCEPTUAL CONTROL ARCHITECTURE FOR DYNAMIC ENERGY STORAGE IN DYNAMIC POSITIONING Figure 1 shows a control architecture that intends to illustrate the main idea. In a DP system there is a positioning controller that commands forces in surge and sway directions, as well as the yaw moment, in order to keep position and heading at their ...

Over the last decade, the development of thermal energy storage techniques effectively promotes the utilization of renewable and clean energy and alleviates the environmental pollution caused by fossil energy combustion [1], [2], [3], [4]. Among the various heat storage techniques, latent heat thermal energy storage (LHTES) has attracted extensive ...

Networked microgrids are considered an effective way to enhance resilience of localized energy systems. Recently, research efforts across the world have been focusing on the optimal sizing and pre-positioning problems of distributed energy resources for networked microgrids. However, existing literature on mobile energy storage systems mainly focused on single pre-positioning ...

Abstract. This work is a feasibility study of a 19-passenger hybrid-electric aircraft, to serve the short-haul segment within the 200-600 nautical miles. Its ambition is to answer some dominating research questions, during the evaluation and design of aircraft based on alternative propulsion architectures. The potential entry into service (EIS) is foreseen ...

Batteries are an example of electrical energy storages that has been field-validated as a reliable backup resource that improves the resilience of distribution networks especially against the floods. However, employing these devices for resilience improvement is inadequate to legitimize their installation economically. Hence, they are frequently placed ...
