During charging and discharging, a supercapacitor used for energy storage generates heat owing to internal resistance, which increases the internal temperature of the capacitor. If temperature inside a supercapacitor is very high, the capacitor's performance deteriorates, cycle life reduces, and electrolyte evaporates and damages the capacitor.

Therefore, alternative energy storage technologies are being sought to extend the charging and discharging cycle times in these systems, including supercapacitors, compressed air energy storage (CAES), flywheels, pumped hydro, and others [19, 152]. Supercapacitors, in particular, show promise as a means to balance the demand for power ...
