Cryogenic energy storage (CES) refers to a technology that uses a cryogen such as liquid air or nitrogen as an energy storage medium [1]. Fig. 8.1 shows a schematic diagram of the technology. During off-peak hours, liquid air/nitrogen is produced in an air liquefaction plant and stored in cryogenic tanks at approximately atmospheric pressure (electric energy is stored).

A pressurized air tank used to start a diesel generator set in Paris Metro. Compressed-air-energy storage (CAES) is a way to store energy for later use using compressed air. At a utility scale, energy generated during periods of low demand can be released during peak load periods. [1] The first utility-scale CAES project was in the Huntorf power plant in Elsfleth, Germany, and is still ...

Pumped hydroelectricity storage (PHS) is regarded as the industry standard for grid-scale energy storage applications. It has good round-trip efficiency (RTE), with values as high as 85% [1]. As a generation-integrated storage technology, it can be a part of a hydropower generation plant, enabling it to meet utility-scale requirements at minimal additional cost.

Due to humanity's huge scale of thermal energy consumption, any improvements in thermal energy management practices can significantly benefit the society. One key function in thermal energy management is thermal energy storage (TES). Following aspects of TES are presented in this review: (1) wide scope of thermal energy storage field is discussed.

Pumped hydro energy storage is the largest capacity and most mature energy storage technology currently available [9] and for this reason it has been a subject of intensive studies in a number of different countries [12,13]. In fact, the first central energy storage station was a pumped hydro energy storage system built in 1929 [1].
