Lifetime is a period in which energy storage technology equipment can operate. Energy density measures the amount of energy per unit of a size of the installation, and the unit of this index is Wh/kg which is the unit of weight. Self-discharge losses indicate the energy lost during a period in which the system remains idle.

The Office of Electricity's (OE) Energy Storage Division's research and leadership drive DOE's efforts to rapidly deploy technologies commercially and expedite grid-scale energy storage in meeting future grid demands. The Division advances research to identify safe, low-cost, and earth-abundant elements for cost-effective long-duration energy storage.

Pumped hydroelectric storage is the oldest energy storage technology in use in the United States alone, with a capacity of 20.36 gigawatts (GW), compared to 39 sites with a capacity of 50 MW (MW) to 2100 MW [[75], [76], [77]]. This technology is a standard due to its simplicity, relative cost, and cost comparability with hydroelectricity.

ARPA-E funds a variety of research projects in energy storage in addition to long-duration storage, designed to support promising technologies and improvements that can help scale storage deployment. With the support of government and industry, research and development for energy storage technologies can continue to develop and expand.

According to Akorede et al.
