The provision of functional and responsive supply chains through optimization to meet rising energy demand has become imperative.

Thermal energy is at the heart of the whole energy chain with 90% of global energy budget centering round heat conversion, transmission, and storage. Thermal energy also provides a main linkage between the primary and secondary energy sources. As a consequence, thermal energy storage should play a pivotal role in the energy chain.

Thermal energy storage using phase-change materials (PCMs) has received considerable attention owing to its high energy storage density with nearly constant temperature during the operational stage, and it is used as a fundamental approach to address the energy and environmental crisis [1], [2]. PCMs have been employed in the conservation of energy in ...
