

The conventional vehicle widely operates using an internal combustion engine (ICE) because of its well-engineered and performance, consumes fossil fuels (i.e., diesel and petrol) and releases gases such as hydrocarbons, nitrogen oxides, carbon monoxides, etc. (Lu et al., 2013). The transportation sector is one of the leading contributors to the greenhouse gas ...

Any type of potential energy is acceptable for the proposal except chemical, nuclear and RC (remote controlled). All energy sources and peripherals must be on board the vehicle. Engineering ...

In the past few decades, electricity production depended on fossil fuels due to their reliability and efficiency [1]. Fossil fuels have many effects on the environment and directly affect the economy as their prices increase continuously due to their consumption which is assumed to double in 2050 and three times by 2100 [6] g. 1 shows the current global ...

Capacitors exhibit exceptional power density, a vast operational temperature range, remarkable reliability, lightweight construction, and high efficiency, making them extensively utilized in the realm of energy storage. There exist two primary categories of energy storage capacitors: dielectric capacitors and supercapacitors. Dielectric capacitors encompass ...

The series hydraulic hybrid vehicle consists of an engine, a closed volume speed regulating circuit with an accumulator and the transmission system of a traditional vehicle, as shown in Fig. 1. The power output by the engine is transmitted to the variable pump through the clutch, and the variable pump converts mechanical energy into hydraulic energy.

In the process of hydraulic energy regeneration, the hydro-pneumatic accumulators with compressed gas energy storage play a key role. As shown in Fig. 12 (a), the main energy storage element of the hybrid air system developed by the PSA group is a hydro-pneumatic accumulator [29]. The system utilizes two energy

Where "p" is the density of water, "g" is the acceleration due to gravity, "h" is the height drop, and "η" is the efficiency of the turbines/pumps. Calculating the volume of water required for pumped storage involves considering factors such as the height difference between the reservoirs, the efficiency of the pump and turbine, and the desired energy output.

Hydrogen can be stored physically as either a gas or a liquid. Storage of hydrogen as a gas typically requires high-pressure tanks (350-700 bar [5,000-10,000 psi] tank pressure). Storage of hydrogen as a liquid requires cryogenic temperatures because the boiling point of hydrogen at one atmosphere pressure is -252.8°C.

Abstract. In order to ensure and improve the performance of the fuel vapor-containment system (FVS) on a hybrid electric vehicle (HEV), the vapor pressure field of the evaporative (EVAP) system in the refueling process was analyzed. Numerical models were established to describe the pressure change in the EVAP system. Based on these numerical ...
