Battery storage systems release energy in the form of DC or direct current. In a majority of applications, the load is AC-operated. That requires a conversion system, also shortened to PCS.

Equipment cabinet for energy storage system

Energy Storage Systems are structured in two main parts. The power conversion system (PCS) handles AC/DC and DC/AC conversion, with energy flowing into the batteries to charge them or being converted from the battery storage into AC power and fed into the grid. Suitable power device solutions depend on the voltages supported and the power flowing.

The system adopts intelligent and modular design, which integrates lithium battery energy storage system, solar power generation system and home energy management system. With intelligent parallel/or off-grid design, users can conduct remote monitoring through mobile APP and know the operating status of the system at any time.

In renewable energy generation, all the surplus energy produced, which is not being used for current necessity, is stored in energy storage devices or supplied to the grid. Energy storage systems are various forms and sizes. The size, cost, and scalability of an energy storage system majorly depend on the form of the stored energy.

Battery storage is a crucial part of clean energy systems.
