A combustion model of battery vented gases for the energy storage system is developed.. Coupled boundary conditions are introduced to achieve the venting design in OpenFOAM. o Overpressure, flame temperature and wind velocity fields are investigated.. Damage from gas explosion can be significantly mitigated using top venting design.

Among them, explosion suppression technology is an explosion-proof technical measure that adds a certain inert medium to the flammable gas/air mixture to effectively destroy the combustion reaction conditions. When no explosion accident occurs, the added inert medium can shorten the explosion limit range and achieve an inerting explosion-proof ...
