The core element of a flywheel consists of a rotating mass, typically axisymmetric, which stores rotary kinetic energy  $E$  according to (Equation 1)  $E = \frac{1}{2} I \omega^2 [J]$ , where  $E$  is the stored kinetic energy,  $I$  is the flywheel moment of inertia [ $\text{kgm}^2$ ], and  $\omega$  is the angular speed [ $\text{rad/s}$ ]. In order to facilitate storage and extraction of electrical energy, the rotor ...
