

What is a flywheel-storage power system?

A flywheel-storage power system uses a flywheel for energy storage,(see Flywheel energy storage) and can be a comparatively small storage facility with a peak power of up to 20 MW. It typically is used to stabilize to some degree power grids,to help them stay on the grid frequency,and to serve as a short-term compensation storage.

How does Flywheel energy storage work?

Flywheel energy storage (FES) works by accelerating a rotor (flywheel) to a very high speed and maintaining the energy in the system as rotational energy.

What are the potential applications of flywheel technology?

Other opportunities are new applications in energy harvest,hybrid energy systems,and flywheel's secondary functionality apart from energy storage. The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.

Thanks to the unique advantages such as long life cycles, high power density, minimal environmental impact, and high power quality such as fast response and voltage stability, the flywheel/kinetic energy storage system (FESS) is gaining attention recently.

Why are flywheels used in battery storage power stations?

Sometimes battery storage power stations are built with flywheel storage power systems in order to conserve battery power. Flywheels can handle rapid fluctuations better. In vehicles small storage of power flywheels are used as an additional mechanism with batteries,to store the braking energy by regeneration.

How much energy does a flywheel storage system lose per day?

It is now (since 2013) possible to build a flywheel storage system that loses just 5 percentof the energy stored in it,per day (i.e. the self-discharge rate).

The minimum speed of the flywheel is typically half its full speed, the storage energy is be given by $\frac{1}{2} I \omega^2$ where I is the rotor moment of inertia in kgm^2 and the ω maximum rotational speed in rad/s . The power level is controlled by the size of the M/G, so this is independent of the rotor.
