A flywheel-storage power system uses a flywheel for energy storage, (see Flywheel energy storage) and can be a comparatively small storage facility with a peak power of up to 20 MW typically is used to stabilize to some degree power grids, to help them stay on the grid frequency, and to serve as a short-term compensation storage.

How Efficient is Flywheel Energy Storage Compared to Other Energy Storage Technologies? Flywheel energy storage systems are highly efficient, with energy conversion efficiencies ranging from 70% to 90%. However, the efficiency of a flywheel system can be affected by friction loss and other energy losses, such as those caused by the generator or ...

Flywheel energy storage is a promising technology for replacing conventional lead acid batteries as energy storage systems. Most modern high-speed flywheel energy storage systems (FESS) consist of a huge rotating cylinder supported on a stator (the stationary part of a rotary system) by magnetically levitated bearings.
