The core element of a flywheel consists of a rotating mass, typically axisymmetric, which stores rotary kinetic energy E according to (Equation 1) $E = \frac{1}{2} I \omega^2$ [J], where E is the stored kinetic energy, I is the flywheel moment of inertia [kgm^2], and ω is the angular speed [rad/s]. In order to facilitate storage and extraction of electrical energy, the rotor ...

A flywheel is an inertial energy-storage device. It absorbs mechanical energy and serves as a reservoir, storing energy during the period when the supply of energy is more than the requirement and releases it during the period when the requirement of energy is more than the supply.
