Flywheel Energy Storage System (FESS), as one of the popular ESSs, is a rapid response ESS and among early commercialized technologies to solve many problems in MGs and power systems [12]. This technology, as a clean power resource, has been applied in different applications because of its special characteristics such as high power density, no requirement ...

Flywheel energy storage (FES) works by accelerating a rotor (flywheel) to a very high speed and maintaining the energy in the system as rotational energy. The energy is converted back by slowing down the flywheel. Most FES systems use electricity to accelerate and decelerate the flywheel, but devices that directly use mechanical energy are being developed.

Energy storage systems designed for microgrids have emerged as a practical and extensively discussed topic in the energy sector. These systems play a critical role in supporting the sustainable operation of microgrids by addressing the intermittency challenges associated with renewable energy sources [1,2,3,4]. Their capacity to store excess energy during periods ...
