Concentrated solar thermal power generation is becoming a very attractive renewable energy production system among all the different renewable options, as it has have a better potential for dispatchability. This dispatchability is inevitably linked with an efficient and cost-effective thermal storage system. Thus, of all components, thermal storage is a key one.

By storing energy as heat at ultra-high temperatures (1800 K) in a molten metal medium an energy density that exceeds other energy storage methods can be achieved as shown in Table 2. Ultra-High Temperature thermal energy Storage (UHTS) also has the benefit of being clean, reversible and insensitive to deployment location whilst suffering no ...

High-temperature storage concepts in solar power plants can be classified as active or passive systems [29]. An active storage system is mainly characterised by the storage media circulating through a heat exchanger, using one or two tanks as the storage media. Active systems are subdivided into direct and indirect [29].
