How do battery energy storage systems work? Simply put, utility-scale battery storage systems work by storing energy in rechargeable batteries and releasing it into the grid at a later time to deliver electricity or other grid services. Without energy storage, electricity must be produced and consumed at exactly the same time.

Last, the importance of the capital cost of the nuclear component of the total plant decreases relative to the traditional design of a nuclear power plant. In a traditional nuclear power plant, the reactor output matches the turbine-generator output. In this alternative design the turbine-generator output may be three times the reactor output.
