The report advocates for federal requirements for demonstration projects that share information with other U.S. entities. The report says many existing power plants that are being shut down can be converted to useful energy storage facilities by replacing their fossil fuel boilers with thermal storage and new steam generators.

How can energy be stored?

Energy can also be stored by making fuels such as hydrogen, which can be burned when energy is most needed. Pumped hydroelectricity, the most common form of large-scale energy storage, uses excess energy to pump water uphill, then releases the water later to turn a turbine and make electricity.

Thermal energy storage systems store excess solar energy as heat, which can be later converted into electricity. Molten salt and phase change materials are commonly used to store and release heat efficiently. 5) Flywheel Energy Storage. Flywheel systems store kinetic energy generated from excess solar power by spinning a rotor.
