Considering the above requirements, there are several basic concepts that can be used for high-voltage pulse generation. The key idea is that energy is collected from some primary energy source of low voltage, stored temporarily in a relatively long time and then rapidly released from storage and converted in high-voltage pulses of the desirable pulsed power, as ...

Consider that the energy stored is: - Energy =  $\frac{C \cdot V^2}{2}$  where C is capacitance and V is voltage across terminals of the capacitor. Note that when storing energy into a capacitor, storing more volts as opposed to storing the same voltage on a bigger capacitor is more effective for energy.
