Does seasonal thermal energy storage provide economic competitiveness against existing heating options?

Revelation of economic competitiveness of STES against existing heating options. Seasonal thermal energy storage (STES) holds great promise for storing summer heat for winter use. It allows renewable resources to meet the seasonal heat demand without resorting to fossil-based back up. This paper presents a techno-economic literature review of STES.

What are the four methods of sensible heat storage?

Four methods of sensible heat storage; Tank, pit, borehole, and aquifer thermal energy storage are at the time of writing at a more advanced stage of development when compared with other methods of thermal storage and are already being implemented within energy systems.

What is seasonal thermal energy storage (STES)?

Seasonal thermal energy storage (STES), also known as inter-seasonal thermal energy storage, is the storage of heat or cold for periods of up to several months. The thermal energy can be collected whenever it is available and be used whenever needed, such as in the opposing season.

What is a warm-temperature seasonal heat store?

Warm-temperature seasonal heat stores can be created using borehole fields to store surplus heat captured in summer to actively raise the temperature of large thermal banks of soil so that heat can be extracted more easily (and more cheaply) in winter.

How efficient is heat storage?

They predicted a storage efficiency of 83.1%, with the extracted heat supplying a district heating scheme. A HT-BTES at Emmaboda, Sweden, stores waste heat from a foundry in an array of 140,150 m deep boreholes. Heat is stored at between 40 and 45 °C, with the highest efficiency achieved to date at 19% in its sixth year of operation.

In a heat pump the amount of heat produced for every unit of electricity used is known as the Coefficient of Performance (CoP). So, if a heat pump has a CoP of 3.0, then it gives out three units of heat for every unit of electricity it uses. Every heat pump has a published datasheet telling you what its measured CoP is.

Heat pumps are mainly of two forms: Ground Source Heat Pumps (GSHPs) and Air Source Heat Pumps (ASHPs) [12]. GSHPs provide hot water for buildings by using the considerably constant temperature of rocks, soils and water under the land surface to provide heat energy to specific spaces [13]. The source of the thermal energy in buildings supplied by ...

Clean heating refers to utilize solar energy, geothermal energy, biomass energy, etc. for heating (as shown in Fig. 2) the past two years, the Chinese government has issued the "13th five-year plan for renewable energy" and the "winter clean heating plan for northern China (2017-2021)", and carried out the renewable energy heating applications demonstration ...

Storage heaters use off-peak energy to store heat. How do they do that? By warming internal ceramic bricks during the night, when there's less pressure on the National Grid. Like magic, they then release heat gradually throughout the following day. ... Storage heaters used to be thought of as a plan B if you weren't connected to the mains ...

1. Introduction. Combined cooling, heating, and power (CCHP) system has attracted increasing attention owing to its advantages of efficient energy utilization, good economic performance, and low pollution emission [1, 2]. However, the fixed electricity-to-heat ratio, resulted from the integration of prime engine and waste heat recovery unit, difficultly ...

Since 2005, when the Kyoto protocol entered into force [1], there has been a great deal of activity in the field of renewables and energy use reduction. One of the most important areas is the use of energy in buildings since space heating and cooling account for 30-45% of the total final energy consumption with different percentages from country to country [2] and 40% in the European ...

Abstract--Summer heat is potentially one of the largest energy sources in many countries but to be useful it needs to be stored until the winter, preferably without the need for expensive and inflexible district heating systems. It is proposed that the summer heat can be injected into the
