The microstructure and morphology of semi-crystalline polymers profoundly affects their energy storage capability, including different crystalline phases, crystallite size (or lamellae thickness l) and preferred chain orientation [[34], [35], [36]] is well accepted that small crystallite size is favourable for enhancing E_b and therefore achieving higher U_e [33, 37].

The majority of the world's population still cooks using biofuels like wood, agricultural leftovers, and dried animal dung, which lacks the ability to cook efficiently, predictably, safely, and most importantly cleanly. There is an urgent need to develop an alternate, acceptable, hygienic, and low-cost method of cooking, which can be met by Box type Solar Cooker (BSC) ...

storage media in TES units [2-4]. A PCM is a substance that absorbs or releases a large amount of energy during its phase transition--which occurs at a nearly constant temperature. This energy is referred to as the latent heat value (LHV) [5]. A high LHV increases the storage capacity of PCM-based TES units

The distribution box is data on the sea of parameters, generally constitute low-voltage forest according to the electrical wiring, the requirements of the switchgear, measuring instruments, protection appliances, and auxiliary equipment assembled in the enclosed or semi-enclosed metal cabinet or screen width, constituting a low-voltage distribution box.
