How can wind energy be stored in a battery system?

In this project, the fundamental approach is to store the wind energy from the wind turbine in the form of a battery (Lithium-Ion Battery) to overcome the fluctuations in the power demand and frequencies. Furthermore, the Battery system is modelled by employing Simulink software so as to store energy up to 10 MW from the wind power system.

Why are energy storage systems used in wind farms?

As mentioned, due to the intermittent nature of wind speed, the generated power of the wind energy generation systems is variable. Therefore, energy storage systems are used to smooth the fluctuations of wind farm output power.

Who is responsible for battery energy storage services associated with wind power generation?

The wind power generation operators, the power system operators, and the electricity customer are three different parties to whom the battery energy storage services associated with wind power generation can be analyzed and classified. The real-world applications are shown in Table 6. Table 6.

How a battery is connected to a wind farm?

Battery connected to wind farm Methods such as step angle control, inertial use, and energy storage systems are used to reduce wind power output fluctuations. Batteries are also used as storage in combination with wind farms to control the frequency and reduce the power fluctuations.
