

It is the largest planet in the solar system

What is the largest planet in the Solar System?

Jupiter is the largest planet in our solar system by size, mass, and volume. By size, Jupiter is gigantic, having a diameter of 142,800 kilometers or about 11 Earths across. In terms of volume, you could fit every other planet inside Jupiter, and there would still be space left over. Jupiter is more than 300 times the mass of the Earth.

Are Jupiter and Saturn the largest planets in the Solar System?

The outer solar system contained vast amounts of hydrogen and helium, allowing planets like Jupiter and Saturn to become the largest planets in the solar system. Interestingly, Jupiter and Saturn are probably the two most similar planets in the solar system. Both are composed chiefly of hydrogen and helium and are covered in large bands of gas.

Is Jupiter a gas giant planet?

About 4 billion years ago, Jupiter settled into its current position in the outer solar system, where it is the fifth planet from the Sun. A 3D model of Jupiter, a gas giant planet. The composition of Jupiter is similar to that of the Sun - mostly hydrogen and helium.

How big is Jupiter compared to Earth?

Jupiter is the largest planet in the solar system. It's about 11 times wider than Earth with an equatorial diameter of 88,846 miles (about 142,984 kilometers). Jupiter is the fifth planet from the Sun, orbiting at an average distance of 483.7 million miles (778 million kilometers). It's about five times farther from the Sun than Earth.

Why is Jupiter the biggest planet?

Jupiter, being the biggest planet, gets its name from the king of the ancient Roman gods. Jupiter's environment is probably not conducive to life as we know it. The temperatures, pressures, and materials that characterize this planet are most likely too extreme and volatile for organisms to adapt to.

Is Jupiter a star or a planet?

In fact, Jupiter has the same ingredients as a star, but it did not grow massive enough to ignite. About 4 billion years ago, Jupiter settled into its current position in the outer solar system, where it is the fifth planet from the Sun. The composition of Jupiter is similar to that of the Sun - mostly hydrogen and helium.

It is the largest of the moons of Uranus and the eighth-largest moon in the Solar System. Mean radius: 788.4 ± 0.6 km (490 mi) (0.1235 Earths). Trinculo: Discovered on August 13, 2001, by Matthew Holman, John J. Kavelaars and Dan Milisavljevic at the Dominion Astrophysical Observatory in Victoria, British Columbia, and by using the 4-m reflector ...

The 9 Planets in Our Solar System. ... Ceres is the largest object in the asteroid belt but was reclassified a dwarf planet in 2006 - even though it's 14 times smaller than Pluto. ... The Sun is the heart of our solar system

It is the largest planet in the solar system

and its gravity is what keeps every planet and particle in orbit. This yellow dwarf star is just one of billions like it ...

This planet has a long orbital duration, 84 years. A day on Uranus, on the other hand, is the shortest, lasting only 17 hours. Currently, 27 moons have been confirmed to orbit around Uranus. The diameter has been estimated at 51.118 km / 31.763 mi. It is the third-largest planet in the Solar System. Neptune. The farthest planet, Neptune. It ...

Jupiter is the largest planet in our Solar System, it's a gas giant and it's known for its giant red spot, which is a giant storm that's been raging for hundreds of years. It's also known for its many moons, including the four ...

With an equatorial diameter of 7926 miles (12,760 kilometers), Earth is the biggest of the terrestrial planets and the fifth largest planet in our solar system. From an average distance of 93 million miles (150 million kilometers), Earth is exactly one astronomical unit away from the Sun because one astronomical unit (abbreviated as AU), is the ...

Saturn is the sixth planet from the Sun and the second largest planet in our solar system. Adorned with a dazzling system of icy rings, Saturn is unique among the planets. Saturn is a massive ball made mostly of hydrogen and helium. The farthest planet from Earth discovered by the unaided human eye, Saturn has been known since ancient times.

Jupiter taken by HubbleTelescope. Second Largest Planet in the Solar System - Saturn. Saturn is the sixth planet from the Sun. It has a diameter of approximately 72,367 miles (116,464 kilometers), making it the second-largest planet in the solar system (after Jupiter) and about 9 times wider than Earth.

OverviewName and symbolFormation and migrationPhysical characteristicsOrbit and rotationObservationMoonsInteraction with the Solar SystemJupiter is the fifth planet from the Sun and the largest in the Solar System. It is a gas giant with a mass more than 2.5 times that of all the other planets in the Solar System combined and slightly less than one-thousandth the mass of the Sun. Its diameter is eleven times that of Earth, and a tenth that of the Sun. Jupiter orbits the Sun at a distance of 5.20 AU (778.5 Gm), with an orbital period of 11.86 years. It is the third brightest natural object in the Earth's night sky, after the Moon and Venus, ...

Parts-per-million chart of the relative mass distribution of the Solar System, each cubelet denoting 2 × 10²⁴ kg. This article includes a list of the most massive known objects of the Solar System and partial lists of smaller objects by observed mean radius.These lists can be sorted according to an object's radius and mass and, for the most massive objects, volume, density, and surface ...

Our solar system has eight planets, and five dwarf planets - all located in an outer spiral arm of the Milky Way galaxy called the Orion Arm. ... Jupiter is the largest planet in our solar system - if it were a hollow shell, 1,000 Earths could fit inside. Expore Jupiter.

It is the largest planet in the solar system

The Solar System [d] is the gravitationally bound system of the Sun and the objects that orbit it. [11] It formed about 4.6 billion years ago when a dense region of a molecular cloud collapsed, forming the Sun and a protoplanetary disc. The Sun is a typical star that maintains a balanced equilibrium by the fusion of hydrogen into helium at its core, releasing this energy from its ...

This illustration shows the approximate sizes of the planets relative to each other. Outward from the Sun, the planets are Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune, followed by the dwarf planet Pluto. Jupiter's diameter is about 11 times that of the Earth's and the Sun's diameter is about 10 times Jupiter's.

Below you will find a list of the planet's mean diameters from largest to smallest. We have included Pluto as further reference point for additional information. 1. Jupiter is the largest planet in the solar system at 139,822 km in diameter. This means that Jupiter is actually more than 28.5 times larger in diameter than the smallest planet ...

Learn about the largest planet in our solar system. Jupiter: The Largest Planet, Level 1 | Jupiter: The Largest Planet, Level 2. National Aeronautics and Space Administration. NASA explores the unknown in air and space, innovates for the benefit of humanity, and inspires the world through discovery. About NASA's Mission ...

Our solar system's largest planet is an average distance of 484 million miles (778 million kilometers) from the Sun. That's 5.2 AU. Jupiter is the largest of the planets, spanning nearly 1.75 millimeters in diameter on our football field scale. Jupiter's diameter is about equal to the thickness of a U.S. quarter in our shrunken solar system.

Jupiter is the fifth planet from our Sun and is, by far, the largest planet in the solar system - more than twice as massive as all the other planets combined. Jupiter's stripes and swirls are actually cold, windy clouds of ammonia and water, floating in an atmosphere of hydrogen and helium. Jupiter's iconic Great Red Spot is a giant storm ...

It is the biggest planet of the Solar System, with a mean radius of 43.440 miles / 69.911 km, a diameter at the equator of about 88.846 mi / 142.984 km, and at the poles, the diameter is only 83.082 mi / 133.708 km. Jupiter is ...

Jupiter is the largest planet in our Solar System, it's a gas giant and it's known for its giant red spot, which is a giant storm that's been raging for hundreds of years. It's also known for its many moons, including the four largest moons in the solar system, called the Galilean moons, named after Galileo Galilei who discovered them ...
