In the coming decades, renewable energy sources such as solar and wind will increasingly dominate the conventional power grid. Because those sources only generate electricity when it's sunny or windy, ensuring a reliable grid--one that can deliver power 24/7--requires some means of storing electricity when supplies are abundant and delivering it later when they're not.

Iron-based flow batteries designed for large-scale energy storage have been around since the 1980s, and some are now commercially available. What makes this battery different is that it stores energy in a unique liquid chemical formula that combines charged iron with a neutral-pH phosphate-based liquid electrolyte, or energy carrier.

Liquid air energy storage is a long duration energy storage that is adaptable and can provide ancillary services at all levels of the electricity system. It can support power generation, provide stabilization services to transmission grids and distribution networks, and act as a source of backup power to end users.

Among Carnot batteries technologies such as compressed air energy storage (CAES) [5], Rankine or Brayton heat engines [6] and pumped thermal energy storage (PTES) [7], the liquid air energy storage (LAES) technology is nowadays gaining significant momentum in literature [8]. An important benefit of LAES technology is that it uses mostly mature, easy-to ...
