How much pressure does a nitrogen generation system need?

If a laser's assist gas inlet draws 350 PSI, then a nitrogen generation system's storage tank is sized to a higher pressure, like 450 PSI (350 PSI to meet peak demand, plus a 100-PSI buffer). "When the laser starts cutting, the storage tank will start to draw down and drop in pressure," Messick said.

How does a nitrogen storage tank work?

Under pressure, the nitrogen molecules react in such a way that prevents them from adsorbing into the small pores of the CMS. The nitrogen bounces off the CMS and passes through the tank vertically and out to a low-pressure nitrogen storage tank.
