

The concepts can be utilized for area-specific experiments and laboratory courses at junior and ... students in the area of mechatronics and renewable energy systems. 3. Intelligent Mechatronic Systems for Green Energy Technologies ... and storage. Other types of renewable energy systems like solar thermal and

The focus on the AI forecast allows to make accurate decisions in real time in the storage system, choosing the best option to meet energy demands in buildings. Interpretation of this data to make the decision taking with minimal human intervention can be carried out by an Intelligent Energy Management System (IEMS) [22]. With the AI approach ...

Using artificially intelligent algorithms, energy-saving trajectory design may be accomplished. Using the nonlinear tracking control, it is possible to achieve the minimum input electrical energy, and the new technology can be implemented in real ...

Energy saving in robotic and mechatronic systems is becoming an evermore important topic in both industry and academia. One strategy to reduce the energy consumption, especially for cyclic tasks, is exploiting natural motion. We define natural motion as the system response caused by the conversion of potential elastic energy into kinetic energy. This motion can be both a forced ...

A game-theoretic technique was implemented for intelligent energy management. The proposed study did not consider consumer preferences while developing scheduling frameworks. The study in Gao et al. (2018) identified the best energy consumption policies for residential customers and optimal storage capabilities. A distributed algorithm ...

**Mechatronics Modeling - General Concepts** K. Craig 5 Classification of System Inputs  
o Input - some agency which can cause a system to respond.  
o Initial energy storagerefers to a situation in which a ... Initial energy storage can take the form of either kinetic energyor potential energy.

Trajectory planning is a crucial and challenging problem for research on intelligent robotic and mechatronic systems, which play a pivotal role in modern manufacturing processes, and especially within the framework of Industry 4.0 [] deed, in every robotic application, it is required to define not only a path, but also a motion law that can guarantee a ...

Dear Colleagues, Following the great success of the "Applications of Intelligent Control Methods in Mechatronic Systems" Special Issue, which was published in December 2020, we have decided to launch a second edition, which will hopefully be as successful and provide as much insight as the first. Mechatronics is an engineering discipline integrating the fields of ...

Development of intelligent mechatronic systems is currently a popular field of study worldwide, with sophisticated mechatronics systems becoming an integral part of the highly automated modern manufacturing sector (Donoghue and Cruden, 2013; Guo et al., 2020; Krueger and Cruden, 2020). Power is the lifeblood of any technology, since it is required to run the ...

precision control in energy conversion processes, and adaptive maintenance techniques that enhance the longevity and reliability of energy systems. Additionally, mechatronics-driven optimization in energy storage and grid integration promotes greater sustainability and resilience. By harnessing real-time data and automation, mechatronics can

Intelligent Mechatronic Systems, & #x02022; Intelligent Mechatronic Networks. An Automated mechatronic system is capable of handling materials and energy, communicating with its environment and is characterised by self-regulation, which enables it to respond to predictable changes in its environment in a pre-programmed fashion. An overwhelming ...

The solution of tasks to design mechatronic systems is performed on the mechanical as well as on the digital-electronic side. Thus, interrelations during design play an important role; because the mechanical system influences the electronic system, and vice versa, the electronic system influences the design of the mechanical system (Fig. 13.4). This means ...

Adaptability and robustness in robotics and mechatronics; Intelligent human-robot interaction in the robotic and mechatronics fields; ... An event-triggered mechanism for UARs was designed, in which the energy consumption was greatly reduced and the communication efficiency between the system and the control terminal was improved. (3) ...

Moreover, mechatronics finds application in the automation of tasks within unstructured environments, including construction fields and farms, where intelligent mechatronic devices contribute to enhanced efficiency and productivity. Subject areas include but are not limited to: Product development; Instrumentation and measurements

2.1. Energy Storage Elements Next, we will classify energy storage elements like inductors, masses, pressurized fluid tanks etc. For this, consider an ideal energy storage element with an energy port and associated power variables  $e$  and  $f$  as shown in Figure 2.

This book gathers selected papers presented at the Fourth International Conference on Mechatronics and Intelligent Robotics (ICMIR 2020), held in Kunming, China, on May 22-24, 2020. The proceedings cover new findings in the following areas of research: mechatronics, intelligent mechatronics, robotics and biomimetics; novel and unconventional ...

Applied Sciences. This work proposes to exploit functional redundancy as a tool to enhance the energy efficiency of a robotic system. In a functionally redundant system, i.e., one in which the number of degrees of freedom required to complete the task is smaller than the number of available degrees of freedom, the motion of the extra degrees of freedom can be tailored to ...

The actual gravimetric energy density is still significantly less than this, because passive components and the housing add to the overall weight. Values for other energy storage units are discussed in [4]. There it is shown that the lead accumulator is not suitable for use as a storage unit for driving energy. The battery ages with use.

Prof. Zhengtao Yu, Ph.D., is the dean of the Faculty of Information Engineering and Automation, the director of the Provincial Key Lab of Intelligent Information Processing, and the Chief Professor of KUST innovation team of Intelligent Information Processing. He is graduated from Beijing Institute of Technology with Ph.D. on Computer Application Technologies in 2005.

This book is a part of the two-volume set produced as the major components of a package of distance-learning material for an undergraduate course Mechatronics: Designing Intelligent Machines, at The Open University, U.K. Volume 1 [2] (reviewed in a previous issue of Mechatronics) covers the fundamentals of mechanics and discusses the ideas of ...

At present, the application of mechatronics technology in the world is more and more extensive, and many countries apply this technology to all areas of life, particularly in the manufacturing sector and application control automation is more significant []. At the same time, as the world's information industry continues to deepen, our country's traditional industries have ...

Artificial intelligence is becoming an increasingly popular tool in more and more areas of technology. New challenges in control systems design and application are related to increased productivity, control flexibility, and processing of big data. Some kinds of systems require autonomy in real-time decision-making, while the other ones may serve as an essential ...
