Three-phase pad-mounted transformer. A three-phase pad-mounted transformer is a ground-mounted electric power distribution transformer in a locked steel cabinet mounted on a concrete pad. These types of transformers are generally smaller (45 - 5000 kVA) but can be produced at larger station sizes as well (up to 10 MVA).

1 · MVDC PLUS® is Siemens Energy" answer to the challenges that regional high-voltage transmission networks and medium-voltage distribution grids increasingly have to deal with. It makes the advantages of DC technology available for applications in AC networks. Transmission distances grow in increasingly liberalized markets.

The direct feed-in of PV electricity into the rail network is a good option for an emission-free future for rail lines. The rail network operates in the medium-voltage range and therefore requires efficient converters in order to efficiently feed in energy generated in the low-voltage range.

By moving from the low to medium voltage range, the power output of subsystems in utility-scale PV power plants can be increased. For example, at the medium voltage range of 1,500 volts, only one transformer is required for 10-12 MVA power, as compared to 3-5 MVA per transformer that is common today.

Medium-voltage direct current (MVDC) microgrids are composed of various energy sources, power electronic devices, energy storage systems, DC buses, and loads. Most of these components have, in nature, nonlinear characteristics and cannot be treated as ideal devices.

Hitachi Energy"s large-medium liquid-filled distribution transformers are used to receive energy from higher voltage levels and to transform and distribute this energy to lower voltage substations or directly to large industrial consumers.. Distribution transformers in this range are three-phase and can be manufactured with an off-circuit tap changer or on-load tap-changer.
